

# Why Data Security Manager SaaS?

IT infrastructure is migrating to the cloud—and how! Most businesses are either already running on the cloud or in-transition to it. If numbers are to be believed:

61%

of businesses migrated their workloads to the cloud in 2020.

81%

of all enterprises have a multi-cloud strategy already laid out or in the works.

67%

of enterprise infrastructure is cloud-based.

## However, there's one more reality we can't ignore.

Cloud-bound organizations constantly find themselves in the crosshair of cyberattacks. The top three most security concerns by these organizations revolve around:

01

### Compliance with Regulatory Mandates

Per the shared responsibility model, the CSP offers security of the cloud, while the end user provides security in the cloud.

02

### Data Breaches

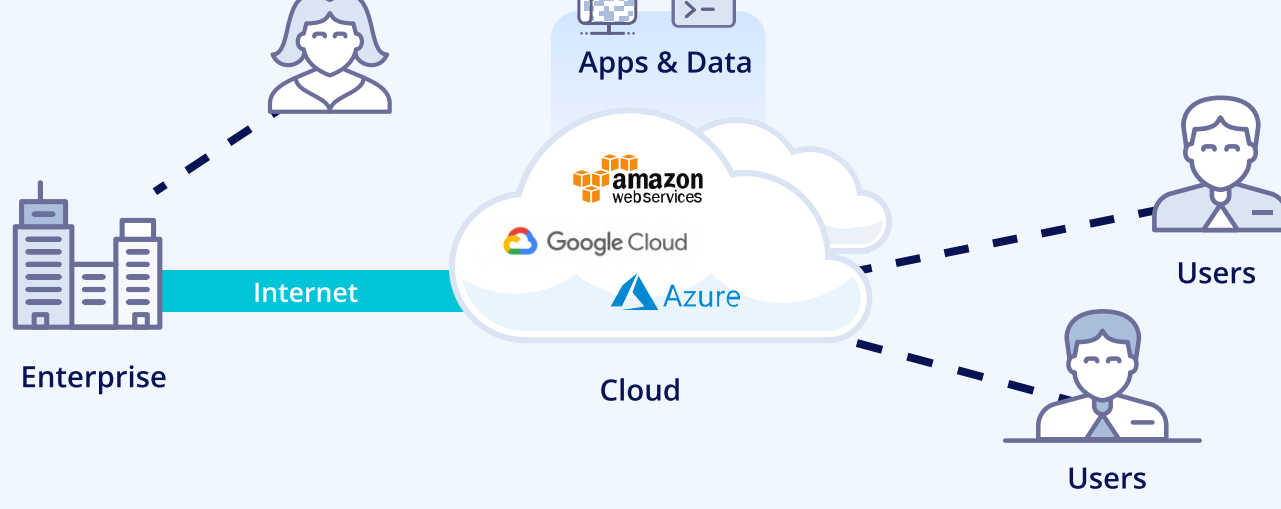

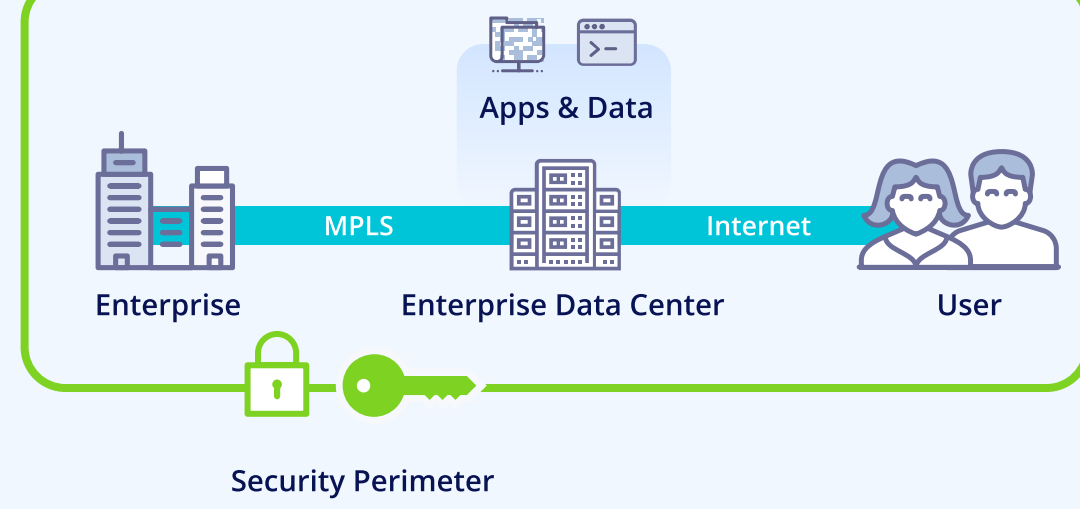

The onus of data protection is upon the enterprise itself, regardless of what any Service-Level Agreement (SLA) or CSP says.

03

### Lack of IT Expertise

The cybersecurity skill gap needs no introduction

The IT infrastructure is changing..

and the existing data security solutions are designed to **prioritize one feature over another.**

It's either robust security at the cost of agility, or complexity over features. Traditional models of data security as we know them, are failing to keep up in a cloud-first world.

### Legacy Data Center

#### Benefits

- On-premises
- Secure
- Cloud neutral

#### Challenges

- Complex
- Not Cloud native
- High CapEx

Expensive to set-up, rigid to scale. It struggles to keep up in a cloud-first set-up.

### Cloud Provider

#### Benefits

- Cloud native
- Easy to use
- Subscription

#### Challenges

- Not neutral
- Not multi-provider
- Data & key together

Easily done but keeping your data and keys together is like putting all your eggs in one basket. A simple breach can have a cascading effect.

## Does this mean that the risk with cloud-first infrastructure is greater than the reward?

Not really. The answer to the modern cloud-based data security lies in a SaaS based data security model. Which raises the obvious questions of “Why SaaS Delivered Data Security?”

### Simplified Operations

No hardware to rack and manage. No software to install and update. No specialists to hire. Up and running in hours, anywhere in the world.

### Scalable Integrations

REST and industry standard API support for easy integration to applications, infrastructure, and full DevOps tool chain..

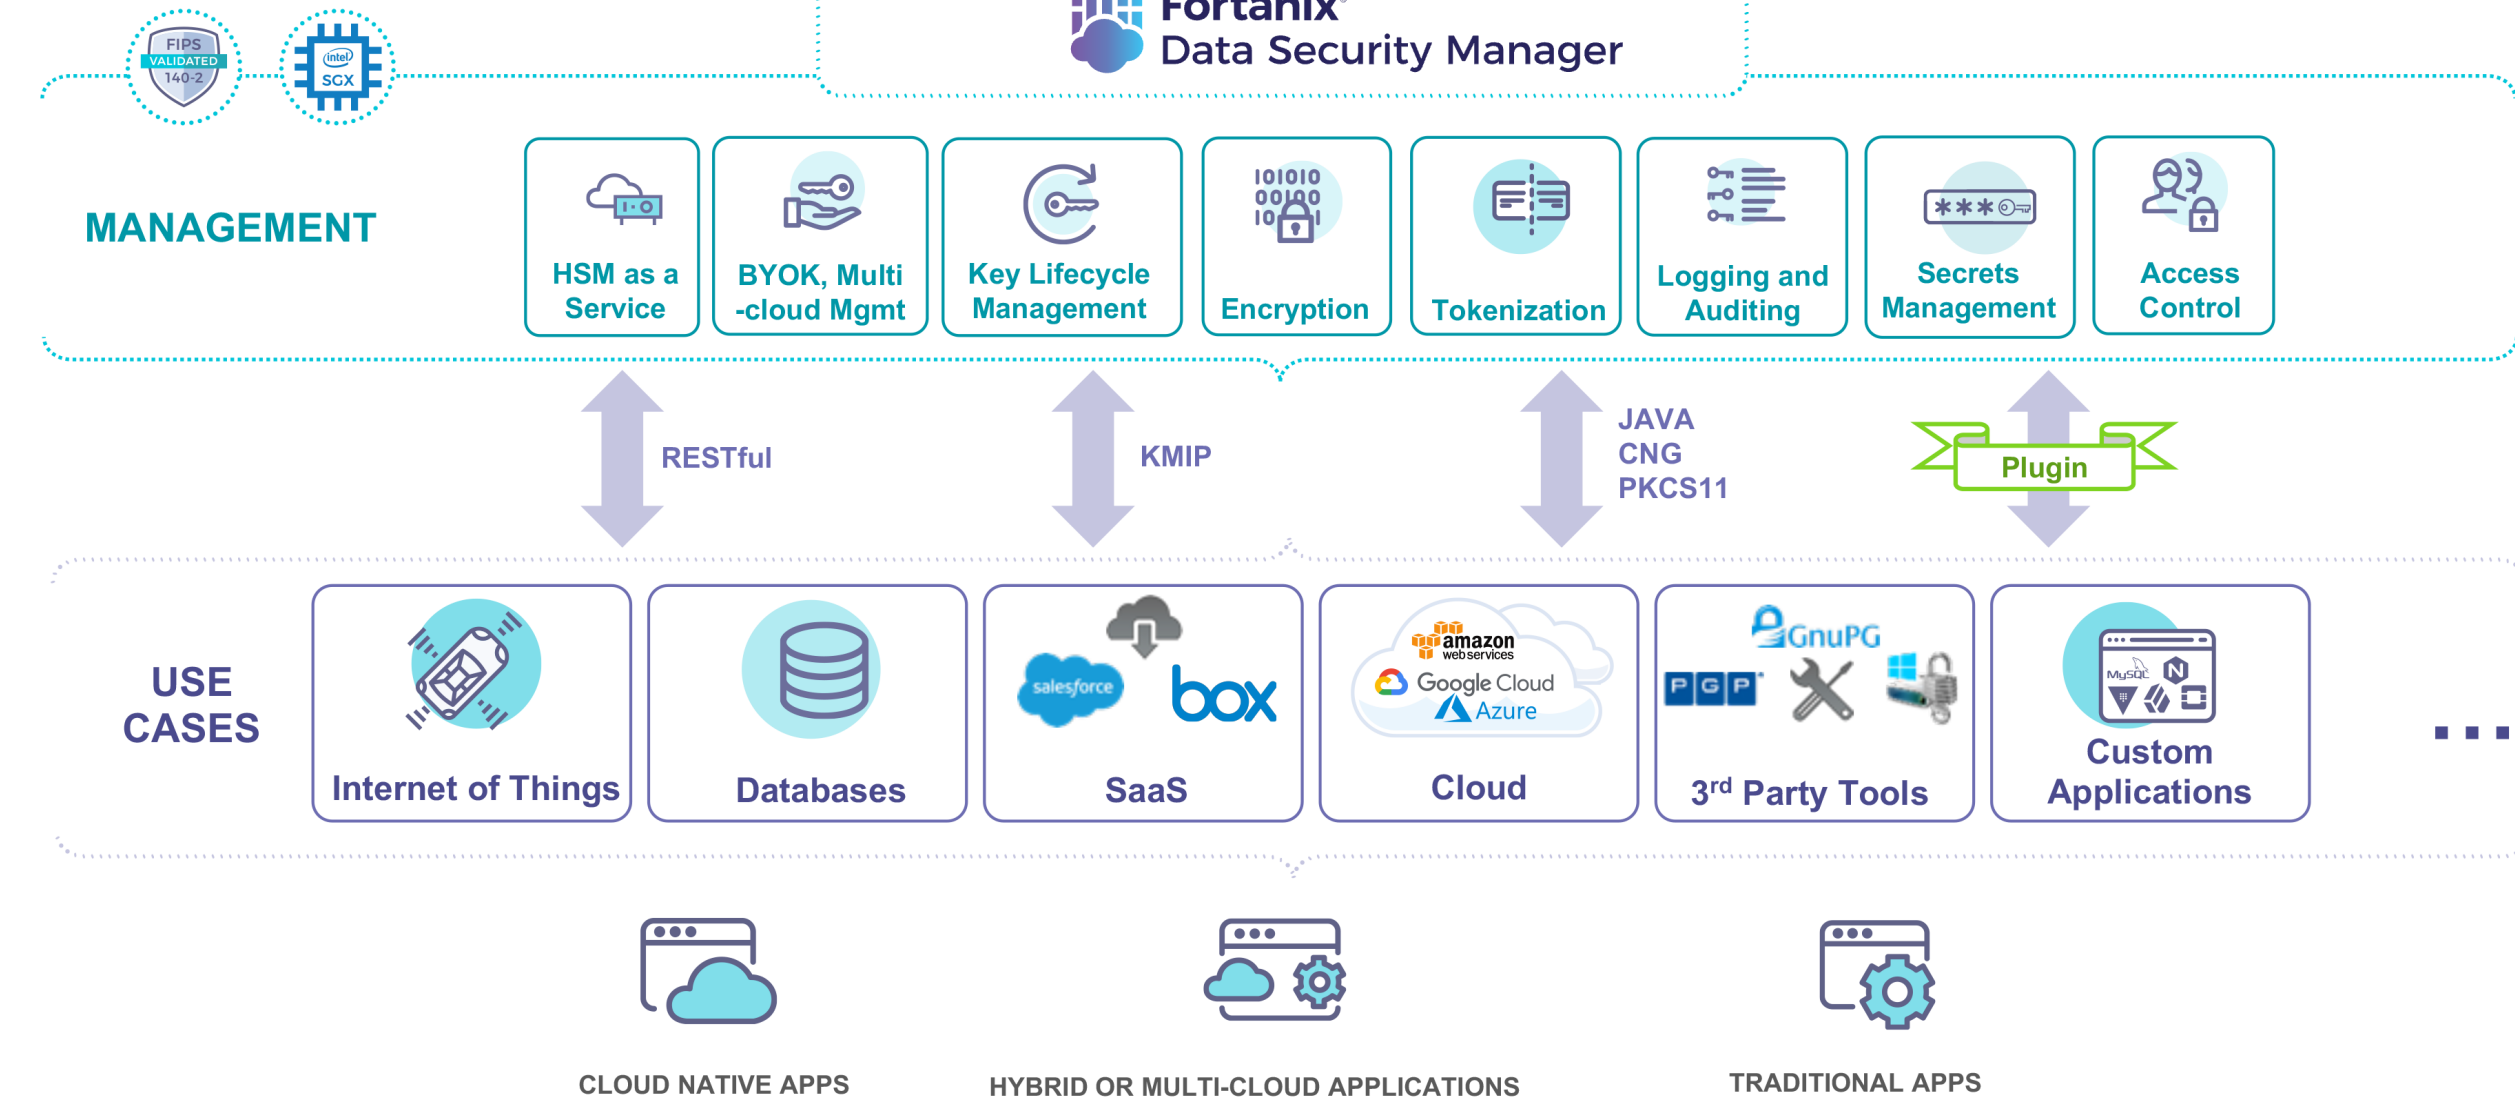

### Maximum Security

FIPS 140-2 Level 3 certified, supplemented by Intel SGX. Only you have access to your keys – not Fortanix, not your cloud provider

## Fortanix<sup>®</sup> DSM SaaS

Built from the ground up to provide the robustness of on-prem security solutions with the agility of a cloud delivered model. A unified platform for **Key Management (KMS), Tokenization, Encryption, and Secrets Management**

If you're still sitting on the fence, here are top three reasons why you should go for the new **Fortanix Data Security Manager SaaS.**

### SECURE

- ▶ Separates your data and keys and provides complete key secrecy.
- ▶ Staff augmentation with crypto experts.
- ▶ Built using FIPS 140-2 Level 3 certified hardware.

### SIMPLE

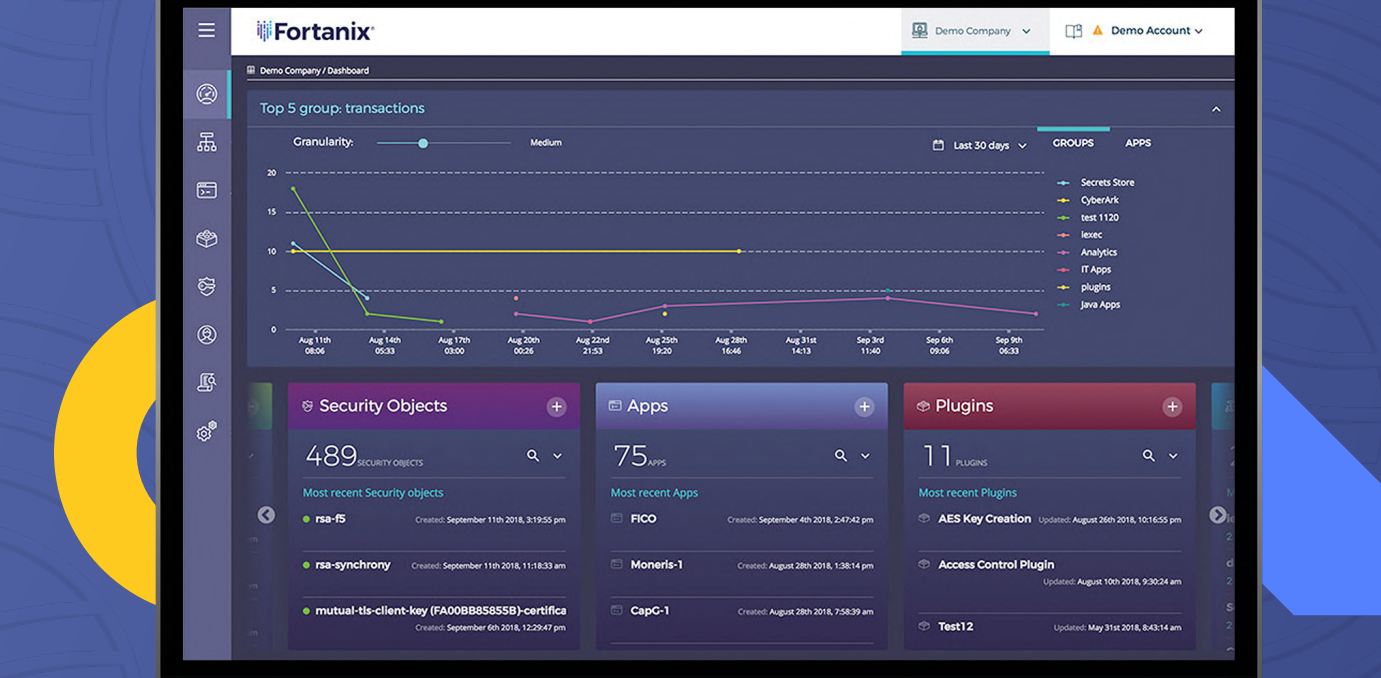

- ▶ Instantly available with zero upfront costs.
- ▶ Delivered as a Service, no HW/SW maintenance or management required.
- ▶ Integrate apps in days with REST API's.

### SCALABLE

- ▶ Free and unlimited keys, applications and groups (partitions).
- ▶ Future-proof with DSM SaaS Plugin feature.
- ▶ More use cases = same base subscription cost.

## We would love you to take the DSM SaaS for a spin

Deploy within five minutes and get it free for the first 30 days.
